Chapter 6 (15 days) **Transformations & Similarity:** You may not often take the time to think about how you move objects around as you go about daily life. Many of the movements you make in a given day involve changing directions. In Section 6.1, you will investigate different kinds of motion on a coordinate graph. You will learn how to give directions to slide, flip, turn, and stretch flat shapes. You will also learn how to show where the shapes will be after a series of moves.

In Section 6.2, you will use mathematics you already know to investigate how shapes change size. You will also determine the unknown length of a side in a figure with given information about the lengths of other sides in the figure and in related figures.

Slope & Association:

Previously you used histograms and box plots to answer statistical questions involving a single piece of data. In this chapter, you will learn how to use scatterplots to find relationships between two different measures for a set of objects. For example, you could analyze amounts of fertilizer and plant height to answer a question like, "If I give a plant more fertilizer, will it grow taller?"

Chapter 7 (16 days)

In Section 7.2, you will examine races called triathlons to discover when rates are the same or different. You will also measure of the steepness of lines, a concept called slope, for situations, tables, and graphs.

Finally, you will look at how to make predictions about future events from existing data using trend lines and equations. You will learn about the concept of association that helps describe the relationship between two pieces of data.

Exponents & Functions:

In previous chapters you have investigated relationships that have a constant rate and can be represented as lines on a graph. Other relationships do not change at the same rate all of the time. In Section 8.1, you will investigate patterns of nonlinear growth in tables, graphs, and expressions.

Chapter 8 (18 days)

Following this work, you will look for patterns that will help you simplify complicated expressions with exponents. You will also learn how to represent very large and very small numbers more easily using scientific notation.

Finally, in this chapter, you will learn what a function is. You will explore several non-linear functions and learn how to describe them completely.

Angles & the Pythagorean Theorem:

This chapter focuses on several important geometry concepts. You will begin to investigate several concepts in this chapter, but you will learn a lot more about them in future courses.

Chapter 9 (19 days)

Section 9.1 focuses on angle relationships. The angle relationships you will explore are the ones found with parallel lines and the angles inside and outside of triangles. You will also learn how you can use what you know about angles to decide if a pair of triangles is similar, without even knowing the side lengths!

In Section 9.2, you will focus on the relationships between side lengths in individual triangles. You will learn how to decide if three different lengths will be able to form a triangle and what kind of triangle will be formed. You will use the unique relationship between the side lengths of right triangles to solve problems.

You will also learn some more about numbers. In particular, you will learn the mathematical operation called "square root" and explore how it relates to squaring a number. You will learn how to convert both terminating and repeating decimals to fractions. Finally, you will look at some special numbers called "irrationals."

Chapter 10 (17 days) Surface Area & Volume:

The geometry you explored in Chapter 9 focused on triangles and angles. In this chapter, you will continue to explore geometry concepts but now you will focus on surface areas and volumes.

In Section 10.1, you will explore how to find the side length of a cube when you already know the volume. You will measure the surface area and volume of a cylinder, a three-dimensional solid that has a circle as the base. Finally, you will look at the surface areas and volumes of shapes that cannot be sliced into equal layers, such as pyramids, cones, and spheres.

In the course closure and reflection (Section 10.2), you will work with your team to solve challenging problems that allow you to reflect about your learning throughout the course.
